DROWNING AND CHILDREN WITH AUTISM

At some ages, children with autism are 5 to 14 times more likely to drown in contrast to children without autism. Tragically, two young children with autism have drowned in a little over two years in Palm Beach County. Age and gender are factors (boys are at greater risk) as well as degree of cognitive impairment.

Please read this information carefully, share it with all family members and everyone who helps care for your child so that everyone can be alert and take action to protect their children.

Jack Scott, Ph.D.
 Executive Director
 FAU Center for Autism & Related Disabilities

Palm Beach County Board of
 County Commissioners

Florida Atlantic University CARD is a resource and support program funded by the Florida State Department of Education, dedicated to improving the lives of individuals with autism and related disabilities, including deaf blindness and sensory impairments with other disabling conditions.

DROWNING PREVENTION & AUTISM

“Protect your children from the dangers of the water. We support water safety education in memory of Kaitlin 2003-2008.”

Created by: Task Force on Water Safety
 for Children with Autism Spectrum
 Disorders (ASD) and Related Disabilities

Facts on Drowning

- According to the American Red Cross, it takes as little as a four-inch opening for a child to escape.
- It takes as little as two inches of water and less than 20 seconds for a child to drown.

What should parents & caregivers of children with autism spectrum disorders do?

- Educate yourself about drowning prevention issues.
- Create a plan in case your special needs child wanders away.
- Share your plan with your family, neighbors & emergency personnel and tell them about your child's special needs.
- Get swim lessons for your child & water safety instruction, including CPR, for all of your family members & caregivers.

Children with autism are fascinated by water...

Parents must take action to keep their children with special needs safe from drowning

Practice the **ABCD**'s of drowning prevention:

- **A**dult Supervision
- **B**arriers
- **C**lasses on water safety education, swim lessons and CPR
- **D**rain Safety

Adult Supervision is the most important prevention measure. Even for children who can swim, it is critical to have watchful eyes 100% of the time.

Barriers such as fencing, help protect children but they are not enough. In order to ensure our children's safety, additional barriers such as pool, door & window alarms as well as self-locking and self-latching gates are often necessary. Child anti-drowning alarms can also serve as a barrier.

Classes for water safety are available. Swimming lessons can begin as young as 6 months of age. The American Red Cross offers CPR courses that can be a true lifesaver. See our resource list for contact information on water safety classes, swim and CPR lessons.

Drain Safety is important to prevent suction entrapment injuries and possible death. Encourage children to stay away from drains. Know where your pool or spa's cut off switch is located in case a suction incident occurs. Pool professionals can check drain covers to determine whether or not they are safe.

Children who wander are at higher risk for drowning. **Lost & Found of Palm Beach County** helps families obtain electronic tracking bracelets to speed recovery for a child who wanders. See the resource list for their contact information.

If you have a child with autism spectrum disorder you need to have a Crisis Plan

Be sure to develop a crisis plan before it is needed. For full information about preparing a crisis plan for your special needs child and an "Autism Emergency Contact Form", go to:

www.autismriskmanagement.com.
